Work Experience

Perennial Systems Software Engineer

March 2024 – Present

Project – GForest (FinTech Sustainability Platform)

- Developed and enhanced backend microservices using Spring Boot, SOFA-RPC, Kafka, MySQL, and Redis; architected service boundaries aligned with domain-driven design principles to support modular scalability and independent deployability across the platform.
- Designed idempotent and concurrency-safe transactional operations using row-level locking mechanisms in MySQL, eliminating duplicate processing risks in high-throughput financial workflows and ensuring consistent data integrity under concurrent load.
- Improved API response performance significantly through multi-layer Redis caching strategies, targeted query optimisation with EXPLAIN-driven index tuning, and sharded database access patterns — collectively reducing average latency by eliminating redundant read operations.
- Implemented a hybrid RPC + REST communication model between microservices using SOFA-RPC for internal low-latency calls and REST for external integrations, incorporating intelligent fallback and retry logic to maintain service resilience during partial outages.
- Delivered full end-to-end DevOps pipelines using Docker, Kubernetes, ArgoCD, and Kustomize with environment-based overlays, enabling consistent and reproducible deployments across development, staging, and production environments following GitOps principles.
- Integrated Flipt feature flags into the deployment lifecycle to support progressive rollouts, staged canary testing, and controlled A/B experimentation — enabling safe feature releases with minimal blast radius and real-time toggle capabilities.
- Engineered optimised certificate generation workflows using asynchronous processing with Kafka-backed job queues, reducing blocking time for end-users, and built high-performance dashboard APIs leveraging RPC connection pooling, multi-level caching, and MySQL query tuning to support real-time analytics at scale.

Xapotech Systems Pvt Ltd. Associate Software Engineer

July 2021 – March 2024

Project – Citizen Data Collection Module

- Designed and implemented robust data ingestion and validation workflows using Java, Spring MVC, and Hibernate — incorporating multi-stage validation rules, constraint checks, and error-reporting mechanisms to maintain high data accuracy across large-scale citizen datasets.
- Developed scalable batch-processing pipelines to handle bulk ingestion of structured records, and optimised the MySQL schema through careful index design, query refactoring, and cursor-based pagination strategies, yielding measurable improvements in throughput and processing time.
- Integrated Apache Kafka for event-driven asynchronous ingestion, enabling decoupled processing of high-volume data streams, real-time failure alerting, and system notification delivery — improving fault tolerance and reducing data pipeline bottlenecks.
- Implemented JWT-based stateless authentication, Role-Based Access Control (RBAC) with fine-grained permission matrices, and comprehensive audit logging across all sensitive data operations — ensuring regulatory compliance and traceability for citizen data workflows.
- Managed cloud deployments on AWS (EC2, S3) with environment-specific configurations, and contributed actively to CI/CD pipeline automation using Jenkins and Docker, reducing manual deployment effort and improving release velocity across the team.

NielsenIQ Data Processing Specialist

November 2020 – June 2021

- Performed complex SQL-based data transformation, cleansing, and quality control operations on large-scale global FMCG datasets — applying business rules to standardise formats, resolve inconsistencies, and prepare data for downstream analytical consumption.
 - Executed time-sensitive data migrations with strict SLA adherence, coordinating cross-functional handoffs to ensure zero data loss across migration cycles, with thorough pre- and post-migration validation checks to verify completeness and accuracy.
 - Identified data anomalies and patterns through systematic profiling using statistical summaries and threshold-based checks, and maintained detailed data lineage documentation to support audit trails, regulatory compliance, and traceability of data transformations.
-

Education

Dr. B.C. Roy Engineering College

Bachelor of Computer Applications

August 2017 – July 2020

Skills

-
- Proficient in Java (versions 8, 17, 21) and various frameworks.
 - Experienced in developing microservices, distributed systems, and event-driven architecture.
 - Skilled in RPC, APIs (SOFA-RPC, REST, gRPC), databases (MySQL, Redis, NoSQL), and caching.
 - Familiar with messaging and async systems (Kafka, Message Queues, Batch Jobs, Event Sourcing).
 - Well-versed in cloud and DevOps (AWS, Docker, Kubernetes, ArgoCD, Kustomize, GitOps, CI/CD).
 - Knowledgeable about deployment strategies (Blue/Green Deployments, Canary Releases, Rolling Updates, HPA).
 - Proficient in testing and reliability (JUnit, Mockito, TDD, Concurrency Testing, Transaction Testing).
 - Experienced in quality and tools (SonarLint, Polaris, JIRA, Postman, Swagger).
 - Skilled in monitoring and observability (Prometheus, Grafana, Logging, Metrics, Alerts).
-

Certificate

-
- Oracle Certified Professional: Java SE 8 Developer — Oracle
 - Cognizant Agile Methodology
